

Clip AI / Kling API — Access Request

Our pipeline turns a script into a finished video: an AI director splits it into scenes, Deepix generates one image per scene, a person (or automatic QC) approves each image, and **Clip AI / Kling converts each approved image into a 5-second video clip**. FFmpeg then assembles the final video. It is controlled from a single Dashboard.

PIPELINE

What we are requesting

- An **API key** for image-to-video generation (stored only on the operating machine, never in the repo)
- API access to **create a task, check its status (or webhook), download the result, and cancel**
- Documentation of **rate limits, concurrent tasks and error codes** (including risk-control rejections)
- **Pilot quota**: ~2 scripts, 10–20 clips (at most ~60 requests including retries); larger batches (>100 clips) later

Requested quota: **requests/day** · Only approved scene images and text prompts are sent — no personal data. Retries are capped at 3 to control cost.
